

Origins of components of class
locations in Hungary:
Parental effects on capital accumulation
Péter Róbert

Presentation at
Changing life opportunities under illiberal rule: drivers of
social structural change in Hungary
6-7 July 2023, TÁRKI Social Research Institute

The "low" theory of the mobility studies

- Mobility theory is rooted in stratification theory
- Definition of social situation implies how its intergenerational change is approached and investigated
- Investigating the "from Origin to Destination" relationship can mean
 - analysis of occupational mobility table (Sorokin)
 - status attainment model (Blau & Duncan)
 - class mobility analysis (Erikson & Goldthorpe)
 - educational mobility analysis (Mare)
 - income mobility analysis (Corak)
- Mobility analysis: theoretically weak but pioneering in the sociological methodological innovation

International context

Bukodi et. al. (2017) Intergenerational Class Mobility in Europe

ESS data, ESEC-based class mobility analysis:
low level of intergenerational social mobility

Log-linear / log-multiplicative models reveal
high degree of inheritance (= low level of
social fluidity)

FIGURE 1: Total mobility rates, men aged 25-64 (%)

FIGURE 4: Average global log-odds ratios by countries, men aged 25-64

Background of the current study

- BBC's Great British Class Survey Experiment (GBCS - Savage 2013)
 - theoretical background: three forms of capital (Bourdieu)
 - online data collection on cultural, economic, social capital
- Hungarian adaptation by GfK (led by Ákos Kozák)
 - online fieldwork: January-April, 2014, platforms: Index, Heti Válasz
N=13650, weighted by gender, age, education, residence
- Three forms of capital are based on two empirical measures
 - cultural capital: highbrow cultural consumption (theatre, museum, classical music, book reading) and everyday / emerging leisure activities (internet, social media, TV, doing hobbies)
 - economic capital: household income / consumption units and wealth (property value, savings)
 - social capital: N of contacts and prestige of contacts based on position generator method (= respondent knows people in certain occupations)
- The $3 \times 2 = 6$ indices are standardized (mean=0, SD=1)
(indices serve as input for LCA models for defining classes)

Measuring intergenerational mobility

- **Dependent variables (Destination)**
 - accumulated capital: 6 indices measuring the 3 forms of capital
- **Explanatory variables (Origin)**
 - no data on family background in terms of "capitals"
 - two most traditional indicators of social origin:
 - father's occupation (9 categories: high manager, professional, low manager, clerical, self-employed, skilled worker (ref), service worker, semi-/unskilled worker, agricultural worker)
 - father's education (7 categories: university (MA), college (BA), upper vocational, secondary academic, secondary vocational, apprenticeship, primary school (ref))
- **Control variables:**
 - gender, age, age squared, family status (single vs. in partnership), size of household, roma ethnicity, place of birth (capital, other city, smaller town, village)

Aim of the study

- Possible aim of the study:
the effect of social origin on accumulated capitals
defining classes for origin 'à la Bourdieu' as done for destination is impossible
a kind of status attainment analysis
- Method: a series of OLS regression models are fitted to the data
father's occupation / education are ordered categorical variables and are transformed into dummies
- Results 1: explained variance (adjusted R^2 values)
- Results 2: regression estimates (unstandardized coefficients) for social origin and demographic controls

Model building schema

	Model 1a	Model 1b	Model 2a	Model 2b	Model 3a	Model 3b
Parental education	X	X			X	X
Parental occupation			X	X	X	X
Demographic controls		X		X		X

1a. Parental education (main effect), 1b. 1a + controls

2a. Parental occupation (main effect), 2b. 2a + controls

3a. Parental education + occupation, 3b. 3a + controls

Explained variances (adj. R² values)

Regression estimates for social origin (Model 3b)

Social origin	Income	Assets/Wealth	Highbrow culture	Everyday culture	Size of network	Prestigious contacts
University (MA)	0.805***	0.695**	1.139***	0.314***	0.307***	0.107+
College (BA)	-0.024	0.036	1.245***	0.417***	-0.01	-0.106+
Upper vocational	0.610***	0.326***	0.682***	0.371***	0.191***	0.328***

Semi-/unskilled worker	-0.168***	-0.046	-0.303***	-0.237***	-0.377***	-0.285***
Agricultural worker	-0.176***	-0.118**	-0.373***	-0.349***	-0.365***	-0.561***

Regression estimates for demographics (Model 3b)

Demographics	Income	Assets/Wealth	Highbrow culture	Everyday culture	Size of network	Prestigious contacts
Gender (Male)	0.054***	0.074***	-0.276***	0.023+	0.072***	-0.018
Age	0.000	0.007***	0.006***	-0.034***	0.003***	0.002***
Age squared	-0.020*	0.081***	-0.012	0.055***	-0.130***	-0.035***
In partnership	0.374***	0.322***	0.108***	0.098***	0.181***	0.144***
Size of household	-0.216***	0.002	0.017*	-0.007	0.039***	0.030***
Roma ethnicity	-0.281***	-0.360***	-0.188***	-0.190***	-0.602***	-0.573***
Place of birth						
Capital	0.093***	0.115***	0.250***	0.271***	-0.430***	0.153***
Other city	-0.114***	-0.007	-0.005	0.125***	-0.429***	-0.128***
Smaller town	-0.049**	-0.076***	-0.009	0.100***	-0.044*	-0.138***

Summary / Discussion

- Social origin strongly affects the accumulation of (high) cultural capital and the same holds for the accumulation of income and having contacts with high prestige
- Social origin seems to be less influential for everyday culture, quantity of contacts, as well as wealth (?)
- Limitations of the study:
 - the financial situation in the family background is not measured
 - father's occupation / education are better / worse proxies for capitals in the family
 - accumulation of wealth is strongly underestimated
 - the same may hold for the size of the network but to less extent
 - analyzing class mobility based on the three forms of capital was impossible
- Still: the whole exercise was not useless:
 - results on accumulation of various capitals are in line with other results on low level of intergenerational class mobility and social fluidity in Hungary
 - an addition to the descriptive mobility analyses based on mobility tables with some causal flavour
 - a step towards uncovering the mechanisms of social reproduction

Thank you for your attention
